Jaanch Voice-Assisted Form Verification

Jaanch (जाँच) is a Chrome extension for reviewing important form details before submission. Its primary users are cyber-café and Common Service Centre operators who help applicants complete online forms. Individuals filling out their own forms can use it as well.

The problem

Operators may enter many applications in a day, while applicants have to check small text on a screen they may not control. A typo in a name, date of birth, district, or reference number can be easy to miss. Asking someone to repeat every field takes time; relying on a quick visual scan puts pressure on both the applicant and operator. Jaanch adds a focused review step before submission.

How Jaanch works

After the details are entered, the operator opens Jaanch to review selected fields in large, readable text. Jaanch reads them aloud in Hindi, including spelled letters and grouped numbers, so the applicant can confirm a detail or say what should be corrected. The applicant's spoken reply is transcribed by Gnani Prisma STT through a proxy. Jaanch then uses deterministic rules in the browser to interpret the reply and compare it with the entered value. It flags a possible mismatch and can suggest a correction only when the spoken transcript supports that value after normalization.

The operator chooses whether to accept the suggested correction, keep the current entry, or ask again. Accepting a suggestion displays the value for the operator to type. Jaanch does not edit or submit the form automatically; the human operator remains in control through the final submission.

Scope and safeguards

The prototype focuses on names, dates of birth, districts, and numeric reference fields. Spoken readback stays on the device; reply audio is sent to the speech proxy for transcription. Form values and transcripts are not written to logs, and runtime session data is cleared when the session ends or becomes idle. The v1 verification logic is deterministic and uses no language model.

Jaanch has been evaluated with synthetic test data and has not yet been piloted with real café operators or applicants. Speech recognition can mishear names or numbers, so Jaanch is an assistive check, not a guarantee that a form is correct. The operator should review the result before submitting.
